Acute Bronchitis Prevention

Acute bronchitis can be described as a condition where inflammation occurs in the lining of the bronchial tubes. The tissues of the lining get swollen either as a result of an infection or even because of exposure to toxic stimulants. Most people develop acute bronchitis right after an infection through frequent cold or the flu. Here, the cold or flu trojan that attacks the upper respiratory passageway advances further down the tract and causes bronchitis. In some cases, it is triggered by a bacterial attack too. Other people may get it after the respiratory system passage gets irritated by tobacco smoke, harsh chemicals or air pollutants.

Symptoms

The most easily identifiable symptom is cough. It could be a dry cough or it can generate mucus. Other symptoms that accompany a severe bronchitis cough are since follows: Treatment.

Those Cases Where Signs and Symptoms are Moderate, No Medicines are Needed

It'll heal on its own in a matter of a week or so. During this time, get good amount of relaxation and also strictly avoid contact with cold temperature. Drink lots of water and fluids since it helps in thinning of the mucus and relieves the symptoms. Steam inhalation can bring a lot of relief from the congested feeling.
