

## How to treat Bronchitis in Babies

**M**ost of us are familiar with the term bronchitis, a condition that affects the respiratory system. This condition may produce at any age, but babies tend to be prone as they have a weak immune system. It has been observed that **bronchitis** in babies usually develops throughout winter and early spring. The problem is characterized by inflammation of the bronchial tubes and is mostly caused by deteriorating of common cold or flu. So, generally, bronchitis in infants and toddlers is caused by viruses. However, bacterial infection is also not unusual.

### Is Bronchitis Contagious?

Well, the answer is yes and no! Simply the type of **bronchitis caused** because of viral or infection is infectious. Only some cases of **acute bronchitis** are contagious; and never the chronic ones. Therefore, it is essential to find out the cause in order to determine whether it is transmittable or not. Acute bronchitis is brought on due to viral or bacterial infection. It spreads in the event that a healthy person comes in contact with the bodily fluids of the person struggling with this disease. On the other hand, **chronic bronchitis** will be brought on usually because of cigarette smoking and other reasons, and hence, is not contagious. Longterm asthmatic bronchitis is not contagious.

### This Has Been a Brief Review on Bacterial Bronchitis

Acute bronchitis is usually caused by viruses, but at times, bacteria may also be present along with the virus. Under these circumstances, antibiotics is going to be prescribed in order to alleviate the signs and symptoms. The individual must conclude the course of antibiotics, and refrain from anything that may further worsen the inflamed airways.
